MACLAURIN SERIES – EXTENSION OF BINOMIAL THEOREM

O. Practice questions

1. [Maximum mark: 7] **[without GDC]**

Find the Maclaurin series of the function $f(x) = e^{2x}$ up to and including the term in x^4

(a) by using the formula of the Maclaurin series $f(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \dots$ [5]

(b) by using the Maclaurin series of $e^x = 1 + x + \frac{x^2}{2!} + \dots$ [2]

(a) $f(x) = e^{-x}$ up to and including the term in x^3 . [2]

(b) $f(x) = e^{-x^2}$ up to and including the term in x^6 . [3]

(c) $f(x) = xe^x$ up to and including the term in x^4 . [2]

(d) $f(x) = x^2 e^{-x}$ up to and including the term in x^5 . [3]

(e) $f(x) = e^x - e^{-x}$ up to and including the term in x^5 . [3]

(f) $f(x) = (x+1)e^{4x}$ up to and including the term in x^3 . [4]

This image shows a full page of white paper with horizontal dashed lines, typical of primary school handwriting practice paper. The lines are evenly spaced and run across the entire width of the page. There are no margins, text, or other markings present.

This image shows a full page of a handwriting practice worksheet. It consists of approximately 20 horizontal dotted lines spaced evenly down the page, providing a guide for letter height and placement. The background is plain white, and there are no other markings or text present.

(a) Find the first three terms of the Maclaurin series for $\ln(1+e^x)$. [6]

(b) Hence, or otherwise, determine the value of $\lim_{x \rightarrow 0} \frac{2 \ln(1 + e^x) - x - \ln 4}{x^2}$. [4]

This image shows a full page of white paper with horizontal dashed lines, typical of primary school writing paper. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

(a) Write down the value of the constant term in the Maclaurin series for $f(x)$. [1]

(c) Use this series to find an approximate value for $\ln 2$. [3]

[illegible]

(a) Find the Maclaurin series for y up to and including the term in x^2 given that

$$y = -\frac{\pi}{2} \text{ when } x = 0.$$

(b) Show that an approximation for y when $x = 0.1$ is $y \cong 0.1 - \frac{201\pi}{400}$

This image shows a full page of a handwriting practice worksheet. It consists of multiple sets of three horizontal dotted lines, providing a guide for letter height and placement. The lines are evenly spaced across the entire page, leaving ample room for writing practice. There is no text or other markings on the page.

It is given that the Maclaurin series of the function $f(x) = \ln(1 + \sin x)$, up to the term in x^4 is

$$f(x) = x - \frac{1}{2}x^2 + \frac{1}{6}x^3 - \frac{1}{12}x^4 + \dots$$

- (d) By considering the difference of the two series of

$$y = \ln(1 + \sin x) \quad \text{and} \quad y = \ln(1 - \sin x)$$

$$\text{deduce that } \ln 3 \approx \frac{\pi}{3} \left(1 + \frac{\pi^2}{216} \right). \quad [4]$$
[illegible]

This image shows a full page of a document template designed for handwriting practice or general note-taking. It consists of approximately 28 evenly spaced, horizontal dotted lines across the entire width of the page. The background is plain white, and there are no margins, headers, footers, or other markings present.
